O.M. Video Studio

Mac tester guide and test checklist

Version 1.7.0 (experimental Mac build) | 20 October 2026

Thank you for helping to test the Mac version. O.M. Video Studio is a point-and-click app for editing and converting video, audio and pictures (it uses a free tool called ffmpeg behind the scenes). The Windows version is finished; this is the first Mac version, so I need you to try it and tell me what works and what does not.

It takes about 30-45 minutes. Parts 1-4 install the app, Part 5 is the tick chart, Part 6 is what to send back.

What you need

- A Mac running a recent version of macOS (please tell me which one in Part 6).
- An internet connection (about 150 MB of downloads).
- One or two short videos to test with, for example a 20-60 second clip from your phone, plus one photo. Please use files you do not mind me hearing about - nothing is sent to me automatically.
- Headphones or speakers on - the app makes sounds and I need to know if they work.

Part 1 - Find out which Mac you have

There are two builds and you need the right one.

1. Click the **Apple menu** (top-left corner of the screen) and choose **About This Mac**.
2. Look at the line called **Chip** or **Processor**.
   - "Apple M1", "M2", "M3", "M4" (or similar) = **Apple Silicon** - you need the **arm64** file.
   - "Intel" = **Intel Mac** - you need the **intel** file.

Write down the Mac model, chip and macOS version - you will need them in Part 6.

Part 2 - Download and open the app

1. Open Safari or Chrome and go to:

```
https://github.com/BigsmokeLondon/OM-Video-Studio/releases/latest
```

2. Scroll down to "Assets" and click the file for your Mac: **`OM-Video-Studio-macOS-arm64.zip`** (Apple Silicon) or **`OM-Video-Studio-macOS-intel.zip`** (Intel).
3. When it has downloaded, open your **Downloads** folder and double-click the zip. A file called **`OM-Video-Studio`** (with a blue "O.M." icon) appears.
4. Drag **`OM-Video-Studio`** into your **Applications** folder (Finder sidebar).
5. Open Applications, then **right-click (or hold Control and click)** the app and choose **Open**.
6. A box says Apple cannot check the app. Click **Open** again. This is expected - the app is not yet signed with an Apple Developer account. You only do this once.

> **If it still refuses to open:** open Terminal (Part 3, step 1) and paste this line, then press Return, then try step 5 again:

```
xattr -dr com.apple.quarantine /Applications/OM-Video-Studio.app
```

> **Newer macOS versions:** if there is no "Open" button, go to Apple menu > System Settings > Privacy & Security, scroll down and click "Open Anyway" next to O.M. Video Studio.

The first time, the app may say ffmpeg is missing. That is normal - go to Part 3.

Part 3 - Install ffmpeg (one time)

The app needs a free helper called ffmpeg. The easiest way to get it on a Mac is with Homebrew. If the app already shows "ffmpeg" and a version number at the bottom, skip this part.

1. Open **Terminal**: press Cmd+Space, type **`Terminal`** and press Return. A window with text appears.
2. Type **`brew --version`** and press Return. If you see a version number, Homebrew is already installed - go to step 4. If it says "command not found", continue.
3. Install Homebrew: go to **`https://brew.sh`**, copy the one install line shown on that page, paste it into Terminal and press Return. Enter your Mac password if asked (nothing shows as you type - that is normal). When it finishes it prints "Next steps" with two lines to copy and run - do that.
4. Install ffmpeg: paste this and press Return (it takes a few minutes):

```
brew install ffmpeg
```

5. When it says it has finished, close Terminal.

The app also copies this command for you if it finds ffmpeg missing, so you can simply paste it (Cmd+V).

Part 4 - Quit and re-open the app

1. If the app is open, quit it: click the app, then **Cmd+Q**.
2. Open it again from Applications. The bottom-left should now say **Ready | ffmpeg ...**.

You are ready to test. Do not worry if something looks odd - that is exactly what I want to know.

Part 5 - Test chart

Work through each row. Tick ☑️ **Pass** if it did what the right-hand column says, or **Fail** if not. Use Notes for anything strange (an error message, something slow, something that looks wrong). If you cannot do a row, leave both boxes empty and write why.

Tip: on a printed copy, tick with a pen. On the Word file, you can click the box and type an X, or just reply to me with the row numbers that failed.

A. Starting up

#	What to do	What should happen	Pass	Fail	Notes
1	Open the app (Part 4). Look at the title bar and header.	App opens with no error message. Header says "O.M. Video Studio 1.7.0".	☐	☐	
2	Look at the bottom-left status line.	Shows "Ready | ffmpeg x.x" (a version number). If it says ffmpeg is missing, do Part 3 again.	☐	☐	
3	Check the whole window is visible on your screen.	Nothing is cut off at the edges. Note your screen size if it is.	☐	☐	
4	Click "Light mode", then "Dark mode".	Colours switch both ways without glitches.	☐	☐	
5	Quit with Cmd+Q, then open the app again.	App closes and re-opens normally. Your theme choice is remembered.	☐	☐	

B. Choosing files and folders

#	What to do	What should happen	Pass	Fail	Notes
6	Without choosing any file, click "Trim / cut by time".	You hear a warning sound and see "Please select an input file or folder first". The cursor jumps to the Input box.	☐	☐	
7	Click "Browse files..." and choose a short video.	The file name appears in the Input box and an info line shows its size and length.	☐	☐	
8	Drag a video from Finder onto the app window.	The Input box updates to that file.	☐	☐	
9	Click "Choose..." next to "Save in" and pick the Desktop.	The folder path appears in the "Save in" box.	☐	☐	
10	Click the "Recent" drop-down.	Files you used earlier are listed.	☐	☐	
11	Click "Batch folder..." and choose a folder with 2+ videos.	The Input box shows the folder.	☐	☐	

C. Running tools (use one short video)

#	What to do	What should happen	Pass	Fail	Notes
12	Pick one video. Click "Trim / cut by time". Move the start/end sliders.	The window opens. The preview pictures update. Sliders and boxes stay in step.	☐	☐	
13	In the Trim window click "Run".	Progress bar moves, the log says it finished, and you hear a short two-note ping.	☐	☐	
14	Click "Open output folder" at the bottom.	Finder opens at the folder with the new file (name ends _trim).	☐	☐	

#	What to do	What should happen	Pass	Fail	Notes
15	Double-click the new file to play it.	It plays (QuickTime or VLC) and is the length you chose. The original file is unchanged.	☐	☐	
16	Run "Resize" with 720p.	A smaller video is made and plays.	☐	☐	
17	Run "Extract audio from video" as mp3.	An mp3 file is created and plays.	☐	☐	
18	Run "Grab a thumbnail / single frame".	A picture of the video is created.	☐	☐	
19	Run "Export for social media" with TikTok.	A tall 9:16 video is created and plays.	☐	☐	
20	Run "Compress to a target size" (e.g. Email 10 MB).	A smaller file is created. Two-pass progress goes up twice - that is normal.	☐	☐	
21	Run "Full file report" (Analysis category).	A text file "full report <name>.txt" is saved and opens in TextEdit.	☐	☐	
22	Leave the Input box empty and open "Join clips into one". Add 2 clips with "Add...", then Run.	One joined video is created.	☐	☐	

D. More than one job, queue and sounds

#	What to do	What should happen	Pass	Fail	Notes
23	Pick a video. In any tool window click "Copy ffmpeg command". Paste into Notes (Cmd+V).	A full ffmpeg command is pasted.	☐	☐	
24	Click "Add to queue" in two different tools, then click "Queue" at the bottom and "Run queue".	Both jobs run one after the other. A longer, rising chime plays when all are done.	☐	☐	
25	Use "Batch folder..." with 2+ videos, then run "Resize".	Every video is processed. The longer chime plays at the end.	☐	☐	
26	Press "Cancel" during a long job (e.g. Compress on a longer video).	The job stops. The app stays usable.	☐	☐	
27	Choose a picture (.jpg) as input, then run "Extract audio from video".	The app says the tool does not apply. You hear a low falling sound (failure ping).	☐	☐	
28	Tick "Show ffmpeg commands", then run any tool.	The ffmpeg command is shown in the log box.	☐	☐	

E. Look and feel

#	What to do	What should happen	Pass	Fail	Notes
29	Scroll the tool buttons with your trackpad or mouse wheel.	The list scrolls smoothly.	☐	☐	
30	Click each category in the left sidebar.	Each category shows its own buttons.	☐	☐	
31	Click "A+" and "A-" (Text size).	Text gets bigger and smaller, layout stays tidy.	☐	☐	
32	Resize the window bigger and smaller.	Layout adjusts, nothing overlaps.	☐	☐	

#	What to do	What should happen	Pass	Fail	Notes
33	Change the language drop-down (top right) to another language and accept the restart.	The app restarts in that language. Switch back to English afterwards.	☐	☐	
34	Open a tool and tick "Add to favourites", then click "Favourites".	The tool appears under Favourites.	☐	☐	
35	Untick "Sound", run a small job.	No completion ping this time. Tick it again after.	☐	☐	
36	Look at the Dock icon while the app runs.	It shows the O.M. icon (not a generic Python icon).	☐	☐	

Optional (if you have time): try any other tools that interest you - for example Speed, Crop, Add title, Fade, GIF maker or Remove silence. Note anything that fails.

Part 6 - What to send back

Please send me the following (a message, email or screenshots are fine):

Mac model and year	
Chip (M-series or Intel)	
macOS version	
Which file you used (arm64 or intel)	
Screen size / external monitor?	
Did you hear the sounds? (alert, single ping, long chime, failure sound)	
Overall: did it feel OK to use?	

- This sheet with the ticks, or a list of the row numbers that failed (for example "C4, D5").
- A screenshot of anything that looked wrong (Shift+Cmd+4 lets you pick an area).
- The log file, if anything failed. To find it: in Finder press **Shift+Cmd+G**, paste the line below, press Return, and send me the file called **`om_video_studio_log.txt`**:

```
~/Library/Application Support/O.M. Video Studio
```

> **Good to know:** the app never changes your original files - results are saved as new files next to the original (or in the "Save in" folder). Nothing is uploaded anywhere. Deleting the app from Applications removes it; the log and settings can be deleted from the folder above and a file called .om_video_studio.json in your home folder.

Thank you - this really helps.
